Agenda

- 01** Introduction
- 02** Project Management
- 03** Requirement Specifications
- 04** Software Design
- 05** Testing
- 06** Demonstration

1. INTRODUCTION

Background

Number of local tourists reach 80 million in 2018

Number of tourist in Vietnam increase rapidly

Young tourists tend to explore wild place

People love to talk about their experience

Some people feel difficult to find a travel companion

Exist system

Advantages

- They already have a booking system
- They have huge amount of data

Limitations

- They only focus on famous travel destination
- Their finding-travel-companion feature doesn't have a group chat for discussion

Our proposal

- Focus on both well-known and lesser-known travel places, even if it has not be discovered
- Allows users to share their travel experience by articles and images
- All users' contribution on the system are recorded as point
- Has finding-travel-companion feature

2. PROJECT MANAGEMENT

Software Development Process

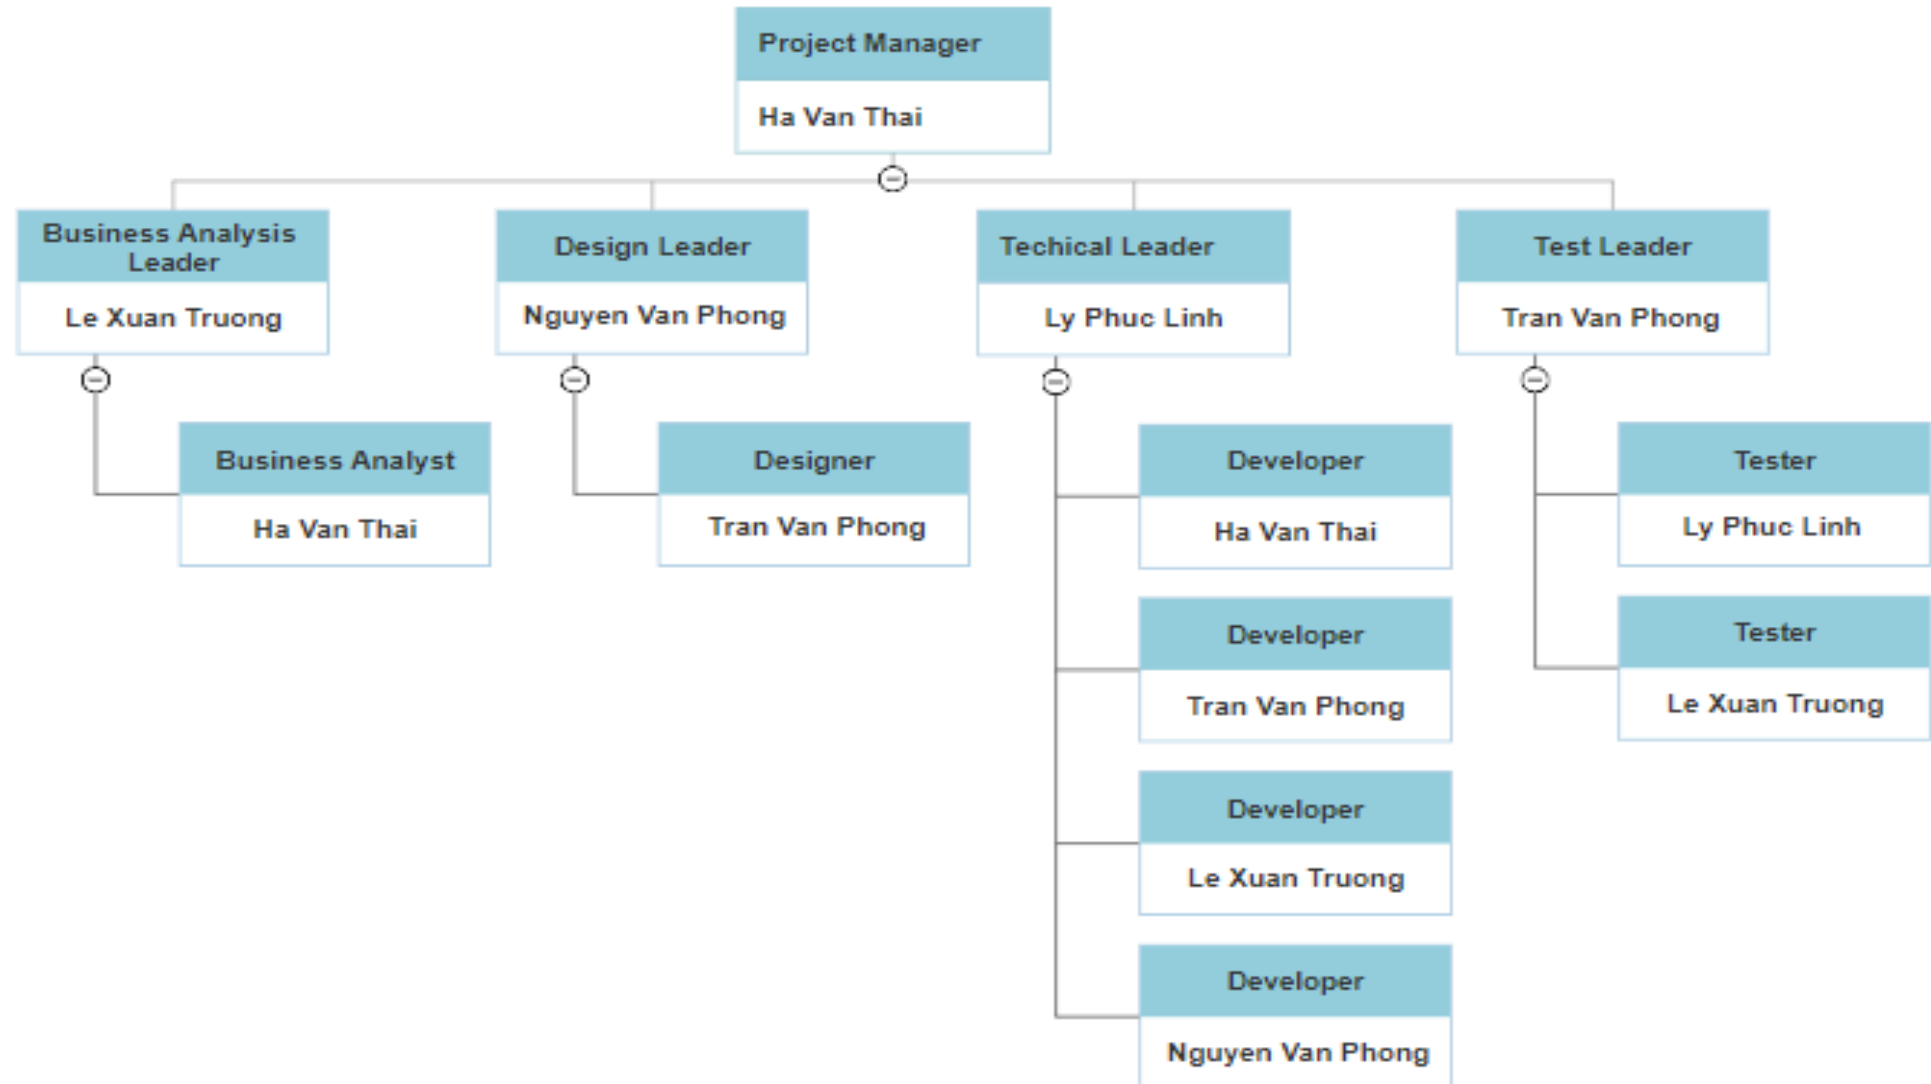

Iterative and Incremental Software Development Model

Advantages:

- ❖ Generates working software quickly and early during the software lifecycle
- ❖ This model is more flexible – less costly to change scope and requirements
- ❖ It is easier to test and debug during a smaller iteration
- ❖ Easier to manage risk because risky pieces are identified and handled during its iteration

Organization Structure

Work Breakdown Structure

3. SOFTWARE REQUIREMENT SPECIFICATION

Roles

Actor	Description
Guest	Anyone who visits the website and doesn't have an account yet.
Member	Those who has registered an account on TripSharing.
Administrator	Who has the highest the permission level and has responsible for managing the entire website.

Use case Diagram

Non-Functional Requirements

Security

- Use token-based authentication to validate authorize request
- All query made to MongoDB must be escaped so no NoSQL Injection
- All passwords are encrypted with salt

Maintainability

- Microservices architecture for backend
- Object Oriented Programming paradigm is applied
- Using TSLint for a consistent coding convention

Availability

- Google Cloud service for automatic horizontal scalability
- Load balancing technique are applied for both frontend and backend instances.

Performance

- Backend system uses background job for external requests, heavy processing requests such as sending email

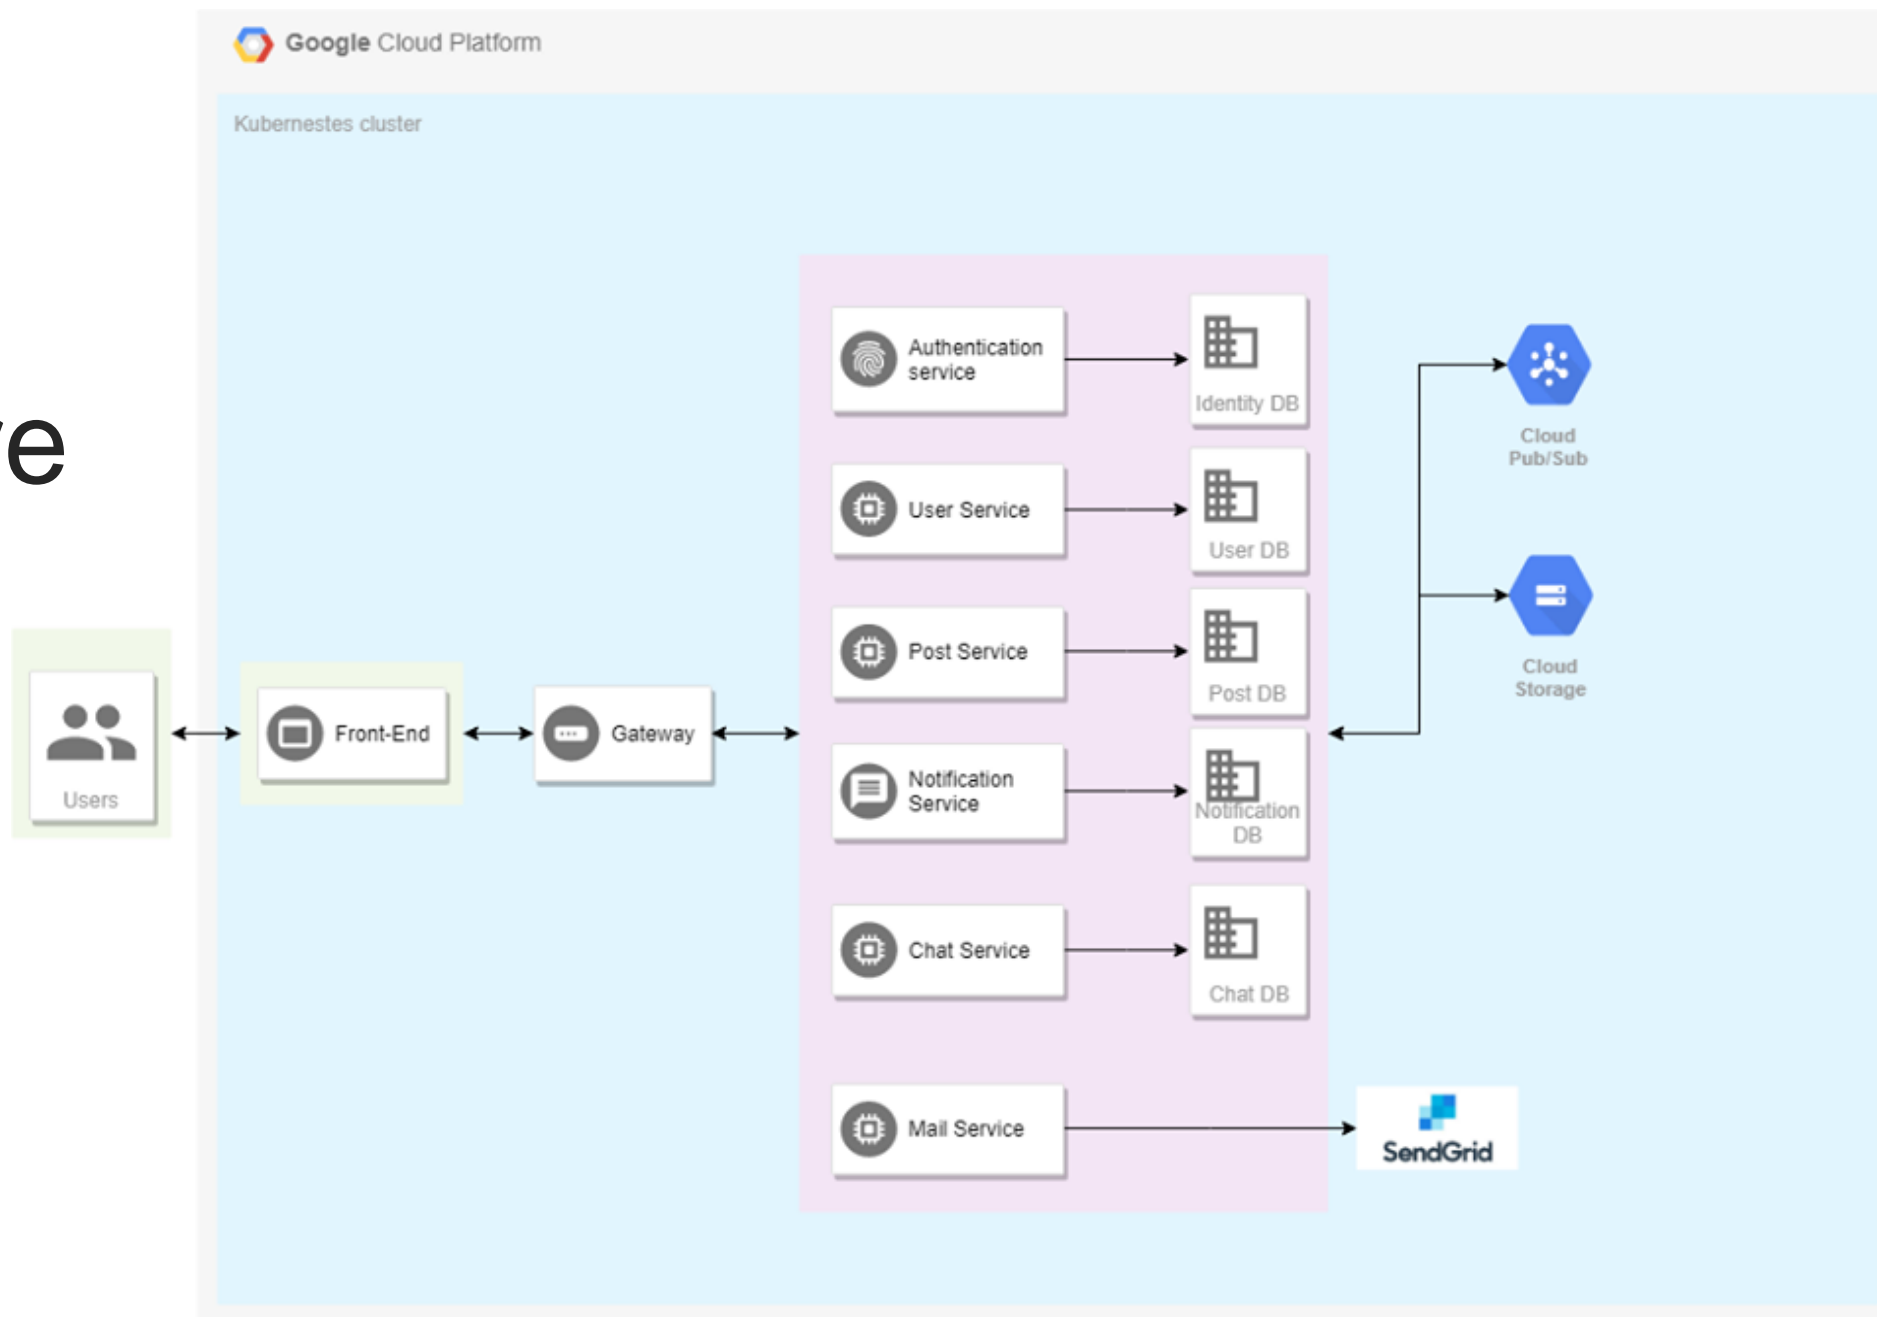

Usability

- Links, buttons and checkboxes are easily clickable
- All significant actions on website have confirm dialog
- Search is available on every page, not just the homepage
